Make Unique

CabinetSense automatically manages the necessary level of uniqueness required for designing cabinets. You do have the option of turning off this automatic feature (see CabinetSense preferences) and manage it yourself.

This version differs from the Sketchup version:

- it does a deep inspection of the component and ensures that all of the necessary child components are also made unique. Any sub-component that has component options will be made unique.
- it does not make the lowest level of components (faces, edges, points...) unique because that has no affect on the attributes of a cabinet. It would also greatly increase the size of your SketchUp model and cause it to become less responsive.

When you want to change the shape of a part ([part shaping](#)), you will need to make the face of that part unique by using the SketchUp Unique option.

Usage:

- Multiple Components
