Bifold Doors - Graphical Only

Here is how I made the perspective of bifold doors:

- Use a hidden partition in the upper cabinet to create two side by side door openings.
- Explode the door component
- Use the rotate tool to position the exploded door component as a bifold door
- Export the current scene to a 2D image that can be used in layout documents.

**Important - do not save the model with exploded doors. Once exploded the doors do not function properly. If you do save the model after exploding the doors you can simply delete the exploded doors and re-import doors from your library.
